Final Project-Mobile only option

For my final project I chose the Mobile only option.

In my spare time I play Australian Rules football, so I decided to make an App for the AFL (The professional league in Australia). I decided to show the user the roster of two teams in the West: The West Coast Eagles and the Western Bulldogs. From there, the user can choose their favorite player names and enter them into a SQLite database.

The API I used is called "Sportsradar". It provides a wide variety of sports data, including the AFL of course.

Documentation for the AFL is found here:
